

Problem-Solving Techniques as Shortest-Path Heuristics

Brute-Force Optimization

Find any solution first, no matter how bad

then look for shortcuts along it

Break Down the Problem

Identify a middle point you must go through

Then solve two smaller sections

Hunt for Properties

Ignore the goal. Look for properties of the problem

then try to use them to design an algorithm

Cycle Through the DS&A Catalog

Ignore the problem. Cycle through techniques

and see if they can be used for this problem

Tackle an Easier Version

Remove half the edges before finding a path

and see if it still holds up when you re-add them

Articulate Your Blocker

Tell the interviewer the things you tried

so they can point out the edge you missed

Brute-force Optimization

Find any solution first, no matter how bad

then look for shortcuts along it

Break Down the Problem
